If you are frustrated with poor performance or unreliability of your SQL Server, or if your applications don't respond like they did in the past, or if you wonder if your configuration is optimized or your databases are setup correctly, then JSWco can help! We have a SQL Server Certified **Master** DBA who can review and assess your SQL Server environment and if needed, provided a set of recommendations based on the latest best practices to improve operations, provide the sought-after results, and lower your risk.

Description

The check-up starts with an in-depth interview to talk through major pain points. Typical areas for inquiry include security, performance, data governance, general setup, configurations, permissions, Reporting Services, individual reports, disaster recovery, expansion plans, etc. JSWco will access the SQL Server environment using a remote connection, to examine the servers, assess the setup and operations, test processes, and run diagnostics.

Deliverables

A *Findings and Recommendation* document will be compiled based on the interview, observations, and system tests. This document will suggest changes that should be made, indicate their priority or urgency, and outline a remediation and enhancement plan for consideration.

Plus, if appropriate, an *Envision Statement* document will be prepared to outline strategic opportunities that JSWco has identified that would improve performance, add efficiency, or reduce systemic risk.

Details

The SQL Server check-up will be completed in one-day. Extended services can be requested. The assessment will be conducted remotely. Appropriate access and permissions will need to be assigned.

A company subject matter expert should be available for an initial discussion, as needed during the assessment.

> " Our SQL Server assessment uncovered several items that we addressed. JSWco's expertise was clearly evident.
> *...food industry IT manager* "
